

Big Data Analytics

Lecture 1: Introduction and Motivation

Huanle Xu

Motivation

- Do you want to work in these companies?

Motivation of the Course

- Do you want to understand what is **big data**?
What are the main characteristics of **big data**?
- Do you want to understand the infrastructure
and techniques of **big data analytics**?
- Do you want to know the research challenges
in the area of **big data learning and mining**?

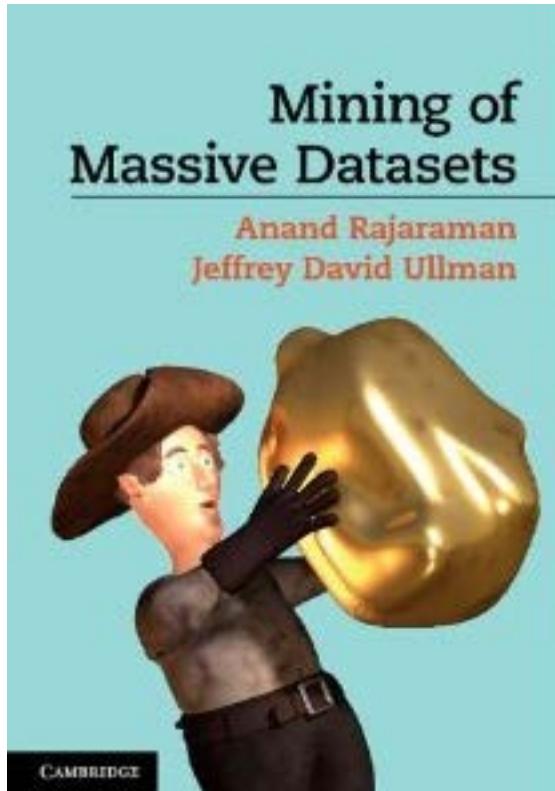

Course Objective

1. To understand the current key issues on **big data** and the associated **business/scientific data applications**;
2. To teach the fundamental techniques and frameworks in achieving **big data analytics** with **scalability** and **streaming** capability
3. To understand basic optimization methods towards solving big data related problems
4. Able to apply **software tools** for **big data analytics**

Course Description

- Course Homepage: <https://xuhappy.github.io/courses/BigData/>
- This course aims at teaching students the state-of-the-art **big data analytics**, including **techniques, software, applications**, and **perspectives** with massive data.
- The class will cover, but not be limited to, the following topics:
 - **cloud computing, big data processing frameworks, distributed file systems** such as Google File System, Hadoop Distributed File System, CloudStore, and map-reduce technology;
 - **machine learning technology**, SVM models, Deep Neural Networks
 - Data Mining Methods, Clustering, Dimension Reduction, Recommendation systems
 - **optimization methods**, convex optimization, online learning

Textbook for Reference

- Mining of Massive Datasets
- Anand Rajaraman
 - web and technology entrepreneur
 - co-founder of Cambrian Ventures and Kosmix
 - co-founder of Junglee Corp (acquired by Amazon for a retail platform)
- Jeff Ullman
 - The Stanford W. Ascherman Professor of Computer Science (Emeritus)
 - Interests in database theory, database integration, data mining, and education using the information infrastructure.

Textbook

- Amazon
 - <http://www.amazon.com/Mining-Massive-Datasets-Anand-Rajaraman/dp/1107015359>
- PDF of the book for online viewing
 - <http://infolab.stanford.edu/~ullman/mmds.html>

Prerequisites

- Algorithms
 - Basic data structures
- Operating Systems
 - Linux
- Basic mathematics
 - Moments, typical distributions, ...
- Programming
 - Your choice
- **We provide some background, but the class will be fast paced**

What Will We Learn?

- We will learn to analyze different types of data:
 - Data is high dimensional
 - Data is a graph
 - Data is infinite/never-ending
 - Data is labeled
- We will learn to use different models of computation:
 - MapReduce
 - Streams and online algorithms
 - Single machine in-memory

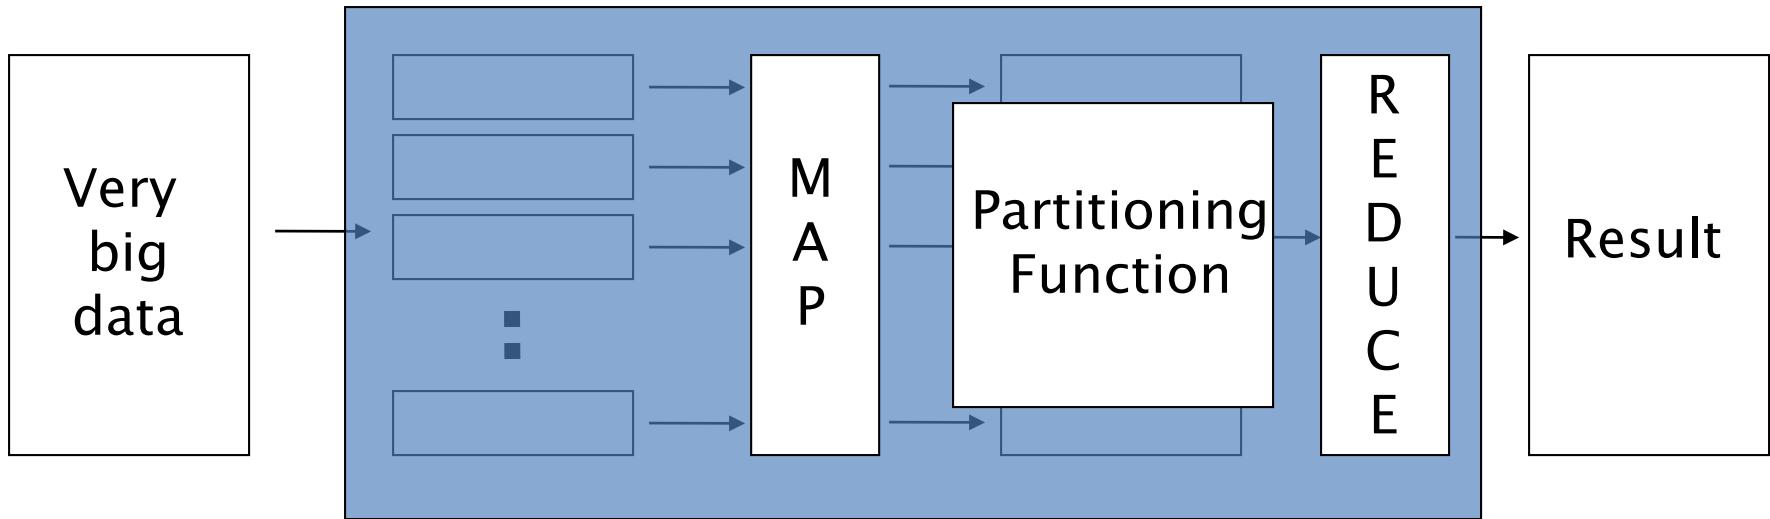

What Will We Learn?

- We will learn to **solve real-world problems**:
 - Recommender systems
 - Link analysis
 - Digit handwritten recognition
 - Community detection
- We will learn **various “tools”**:
 - Linear algebra (SVD, Rec. Sys., Communities)
 - Optimization (stochastic gradient descent)
 - Various big data processing frameworks:
MapReduce, Hadoop

Class Project

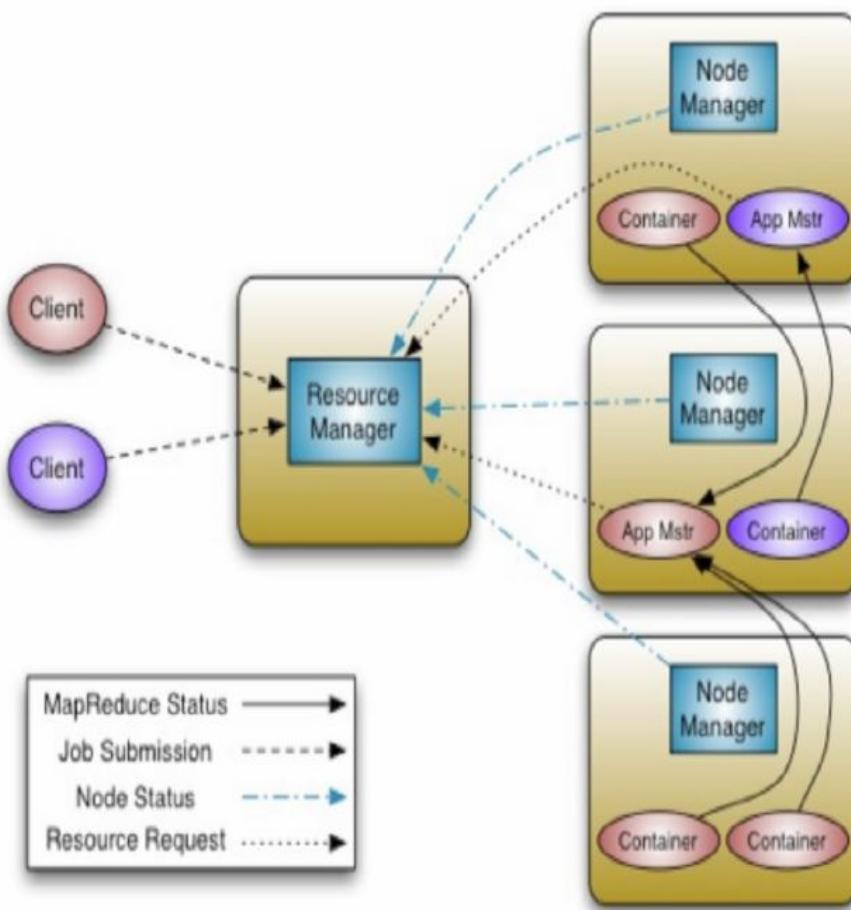

- Project is for everyone
- One-two person/s per project group
- Each group is to design and implement a big data-related project of choice
- Detailed schedule will be announced later

MapReduce

- Map:
 - Accepts *input* key/value pair
 - Emits *intermediate* key/value pair
- Reduce:
 - Accepts *intermediate* key/value* pair
 - Emits *output* key/value pair

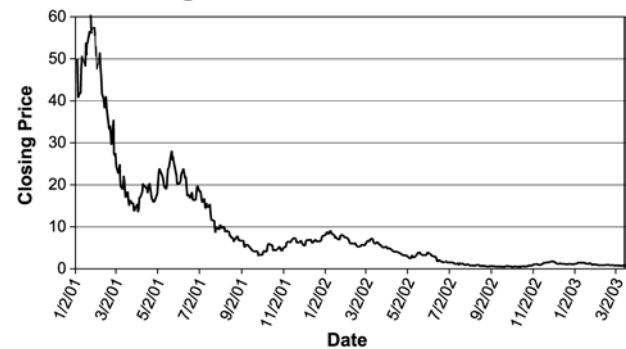

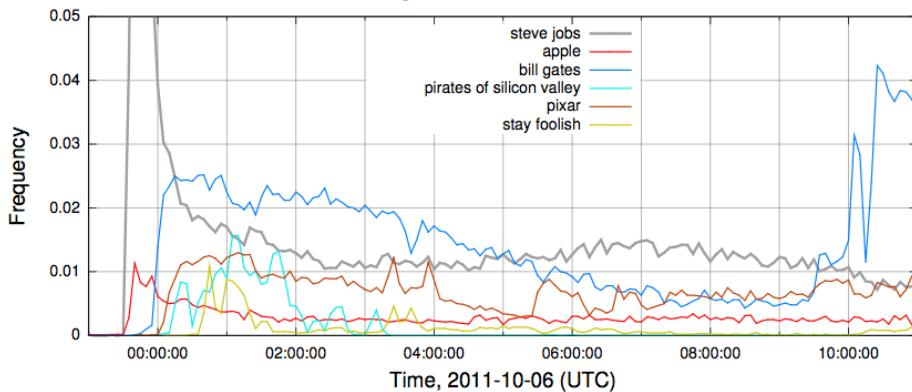

YARN Architectural Overview

- Scalability - Clusters of 6,000-10,000 machines
 - Each machine with 16 cores, 48G/96G RAM, 24TB/36TB disks
 - 100,000+ concurrent tasks
 - 10,000 concurrent jobs

Mining Data Stream

- Stream Management is important when the input rate is controlled externally:
 - Google queries
 - Twitter or Facebook status updates
- We can think of the data as infinite and non-stationary (the distribution changes over time)

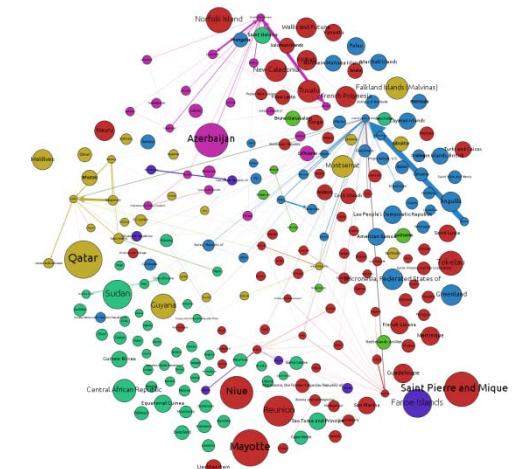

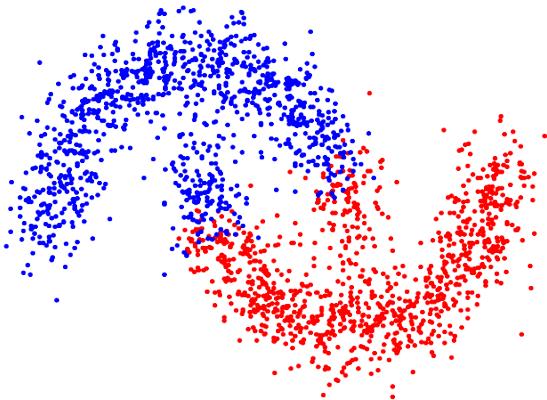

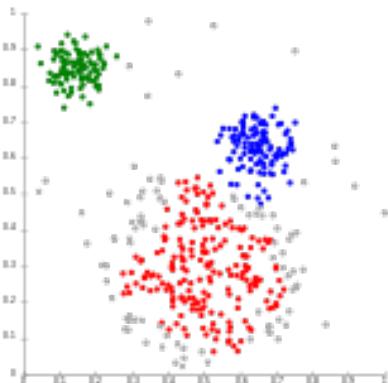

Note: I2 stock price from Jan 2001 to March 2003

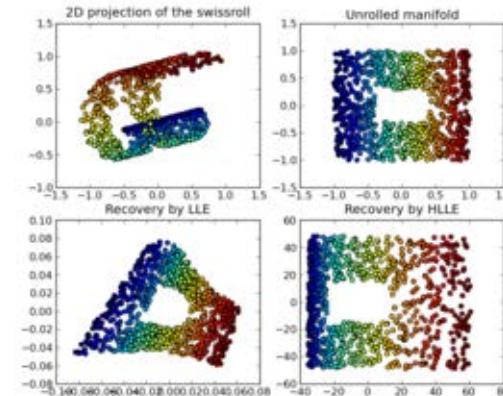

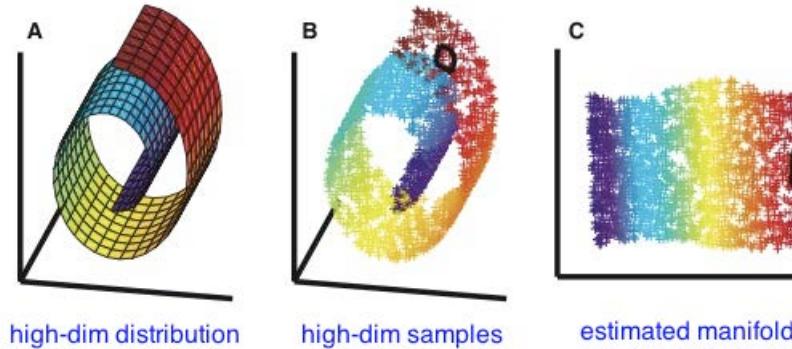

Clustering

- Given a set of points, with a notion of distance between points, group the points into some number of clusters, so that
 - Members of a cluster are close/similar to each other
 - Members of different clusters are dissimilar

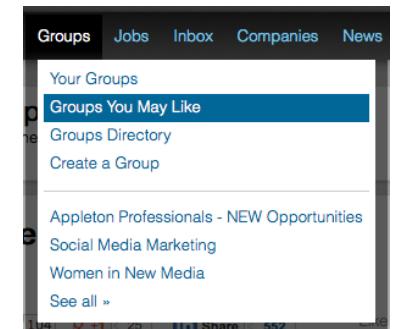

Dimensionality Reduction

- Discover hidden correlations/topics
 - Words that occur commonly together
- Remove redundant and noisy features
 - Not all words are useful
- Interpretation and visualization
- Easier storage and processing of the data

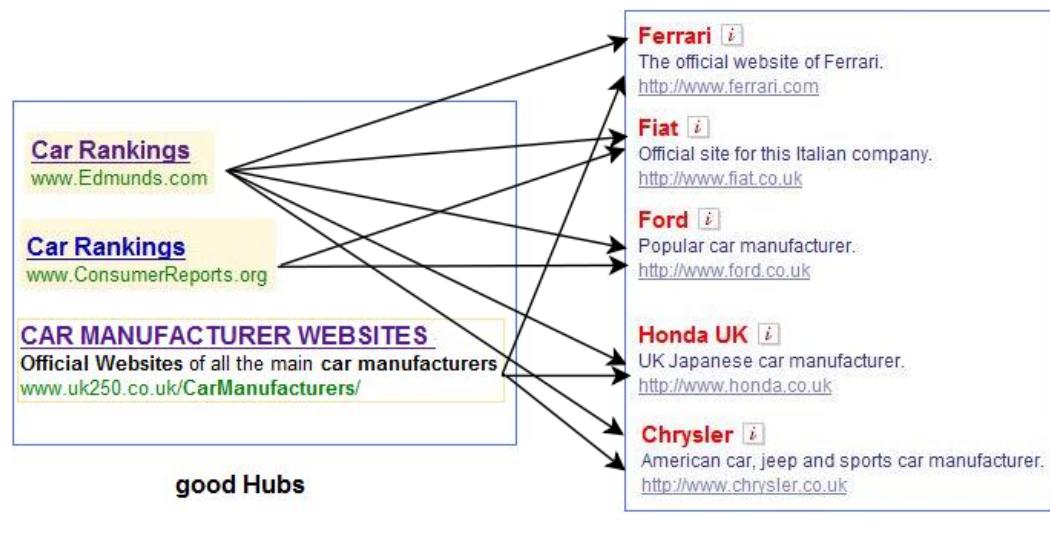

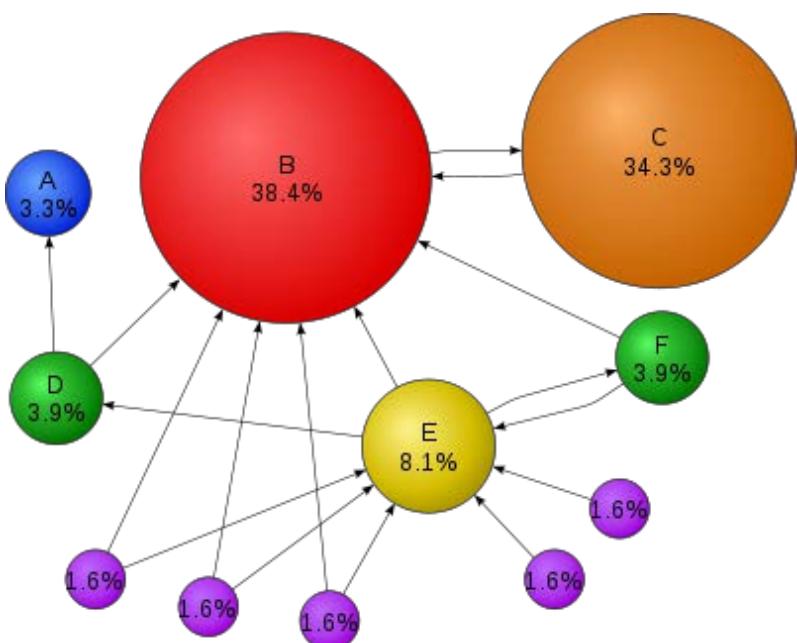

Recommender System

- Main idea: Recommend items to customer x similar to previous items rated highly by x
- Example:
 - Movie recommendations
 - Recommend movies with same actor(s), director, genre, ...
 - Websites, blogs, news
 - Recommend other sites with “similar” content

Link Analysis

- Computing importance of nodes in a graph

Query: Top automobile makers

Introduction to Big Data

Definition of Big Data

- Big data is a collection of **data sets** so **large** and **complex** that it becomes **difficult to process** using on-hand database management tools or traditional data processing applications.

From [wiki](#)

Evolution of Big Data

- Birth: 1880 US census
- Adolescence: Big Science
- Modern Era: Big Business

Birth: 1880 US census

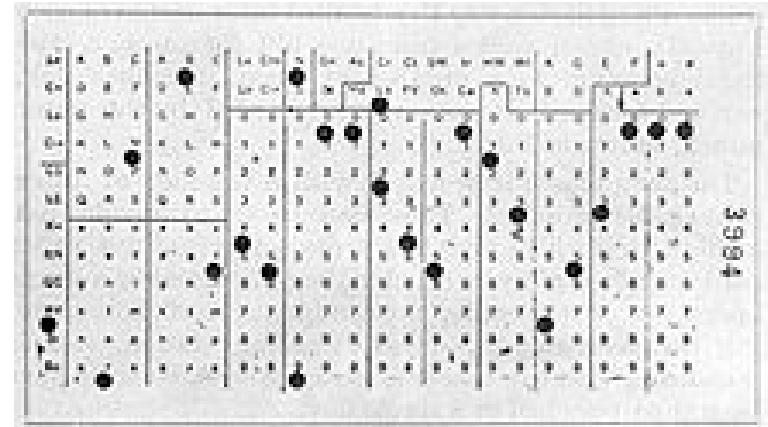

The First Big Data Challenge

- 1880 census
 - 50 million people
 - Age, gender (sex), occupation, education level, no. of insane people in household

The First Big Data Solution

- Hollerith Tabulating System
- Punched cards – 80 variables
- Used for 1890 census
- 6 weeks instead of 7+ years

Manhattan Project (1946 - 1949)

- \$2 billion (approx. 26 billion in 2013)
- Catalyst for “Big Science”

Space Program (1960s)

- Began in late 1950s
- An active area of big data nowadays

Big Science vs. Big Business

- Common
 - Need technologies to work with data
 - Use algorithms to mine data
- Big Science
 - Source: experiments and research conducted in controlled environments
 - Goals: to answer questions, or prove theories
- Big Business
 - Source: transactions in nature and little control
 - Goals: to discover new opportunities, measure efficiencies, uncover relationships

Big Data is Everywhere!

- Lots of data is being collected and warehoused
 - Web data, e-commerce
 - Purchases at department/grocery stores
 - Bank/Credit Card transactions
 - Social Networks

How Big is Big ?

- 2008: Google processes 20 PetaByte **per Day** ($\text{Peta}=10^{15}$)
- Apr 2009: Facebook has 2.5 PB user data + 15 TB/day
- May 2009: eBay has 6.5 PB user data + 50 TB/day
- 2011: Yahoo! Has 180-200 PB of data
- 2012: Facebook ingests 500TB/day

640K ought to be
enough for anybody.

How many users and objects?

- Flickr has >6 billion photos
- Facebook has 1.15 billion active users
- Google is serving >1.2 billion queries/day on more than 27 billion items
- >2 billion videos/day watched on YouTube

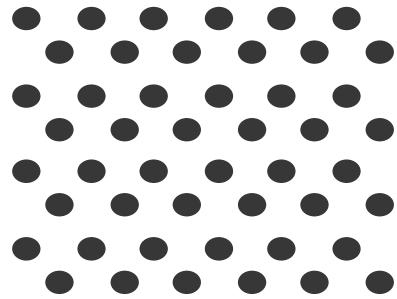

How much data?

- Modern applications use massive data:
 - Rendering 'Avatar' movie required >1 petabyte of storage
 - eBay has >6.5 petabytes of user data
 - CERN's LHC will produce about 15 petabytes of data per year
 - In 2008, Google processed 20 petabytes per day
 - German Climate computing center dimensioned for 60 petabytes of climate data
 - Someone estimated in 2013 that Google had 10 exabytes on disk and ~ 5 exabytes on tape backup
 - NSA Utah Data Center is said to have 5 zettabyte (!)
- How much is a zettabyte?
 - 1,000,000,000,000,000,000 bytes
 - A stack of 1TB hard disks that is 25,400 km high

Characteristics of Big Data: 4V

Volume

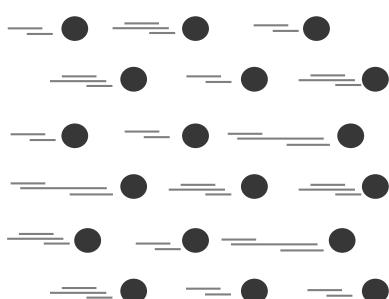

From terabytes to exabyte to zetabytes of existing data to process

8 billion TB in 2015,
40 ZB in 2020
5.2TB per person

Velocity

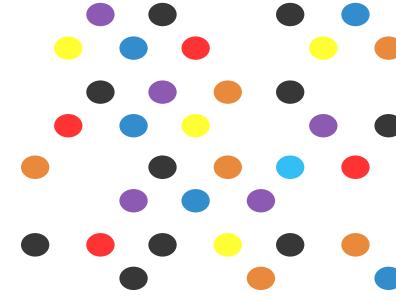

Batch data, real-time data, streaming data, milliseconds to seconds to respond

New sharing over 2.5 billion per day
new data over 500TB per day

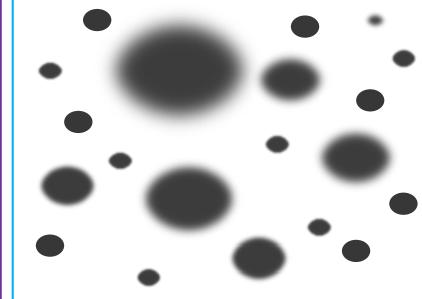

Variety

Structured, semi-structured, unstructured, text, pictures, multimedia

Veracity

Uncertainty due to data inconsistency & incompleteness, ambiguities, deception, model approximation

芦山地震十大不实谣言

2013年04月24日17:41 来源：人民网 手机看新闻

8. 地震局内部消息成都9.2级地震

谣言：自称地震局内部人员的网民称发生9.2级地震。”

How much computation?

- No single computer can process that much data
 - Need many computers!
- How many computers do modern services need?
 - Facebook is thought to have more than 60,000 servers
 - 1&1 Internet has over 70,000 servers
 - Akamai has 95,000 servers in 71 countries
 - Intel has ~100,000 servers in 97 data centers
 - Microsoft reportedly had at least 200,000 servers in 2008
 - Google is thought to have more than 1 million servers, is planning for 10 million (according to Jeff Dean)

What to do with More Data ?

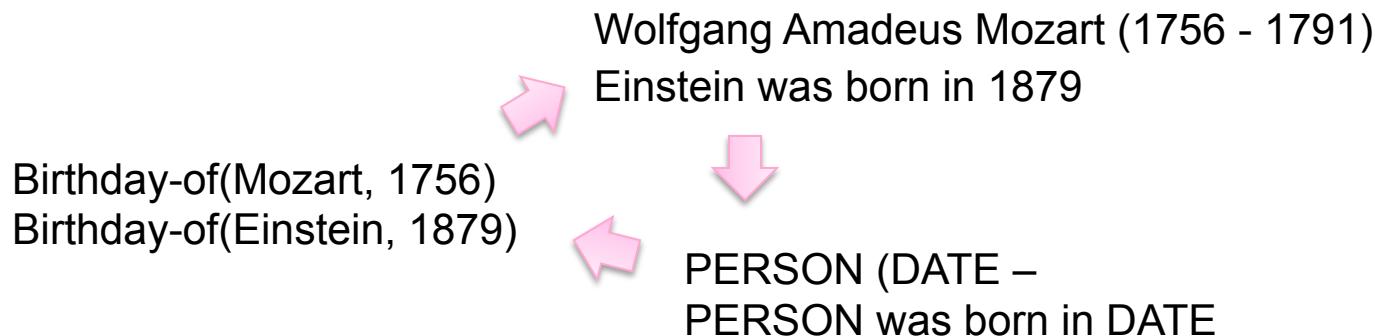

- Answering factoid questions

- Pattern matching on the Web
- Works amazingly well

Who shot Abraham Lincoln? --> ??? shot Abraham Lincoln

- Learning relations

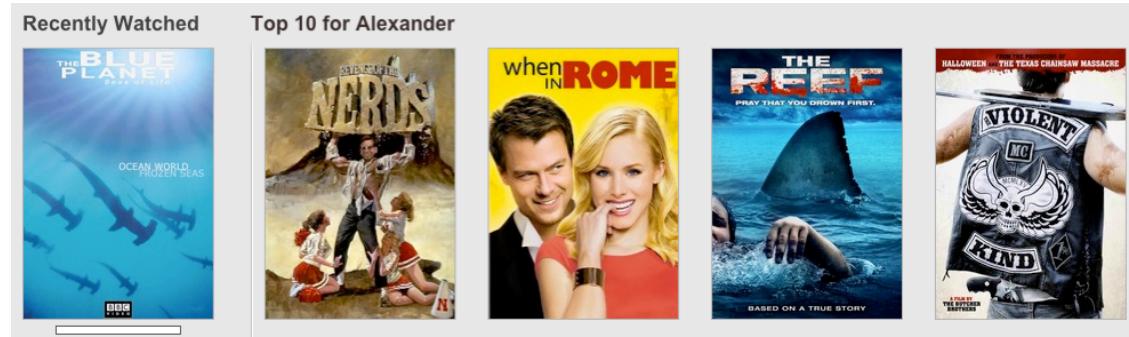

- Start with seed instances
- Search for patterns on the Web
- Using patterns to find more instances

What to do with More Data ? (cont'd)

Personalization

- 100-1000M users
 - Spam filtering
 - Personalized targeting & collaborative filtering
 - News recommendation
 - Advertising

Customers Who Bought This Item Also Bought

Big Data Analytics

- Definition: A process of **inspecting, cleaning, transforming**, and **modeling big data** with the goal of **discovering** useful information, **suggesting** conclusions, and **supporting** decision making
- Hot in both **industrial and research societies**

Big Data Analytics

- Related conferences
 - IEEE Big Data
 - IEEE Big Data and Distributed Systems

User
Behavior

Seller
Experience

What is Data Mining?

- Discovery of **patterns and models** that are:
 - **Valid:** hold on new data with some certainty
 - **Useful:** should be possible to act on the item
 - **Unexpected:** non-obvious to the system
 - **Understandable:** humans should be able to interpret the pattern
- A particular data analytic technique

Data Mining Tasks

- **Descriptive Methods:** Find human-interpretable patterns that describe the data, e.g.
 - Clustering
 - Dimensionality Reduction
 - Association Rule Discovery
 - Sequential Pattern Discovery
- **Predictive Methods:** Use some variables to predict unknown or future values of other variables, e.g.
 - Classification
 - Regression
 - Novelty Detection

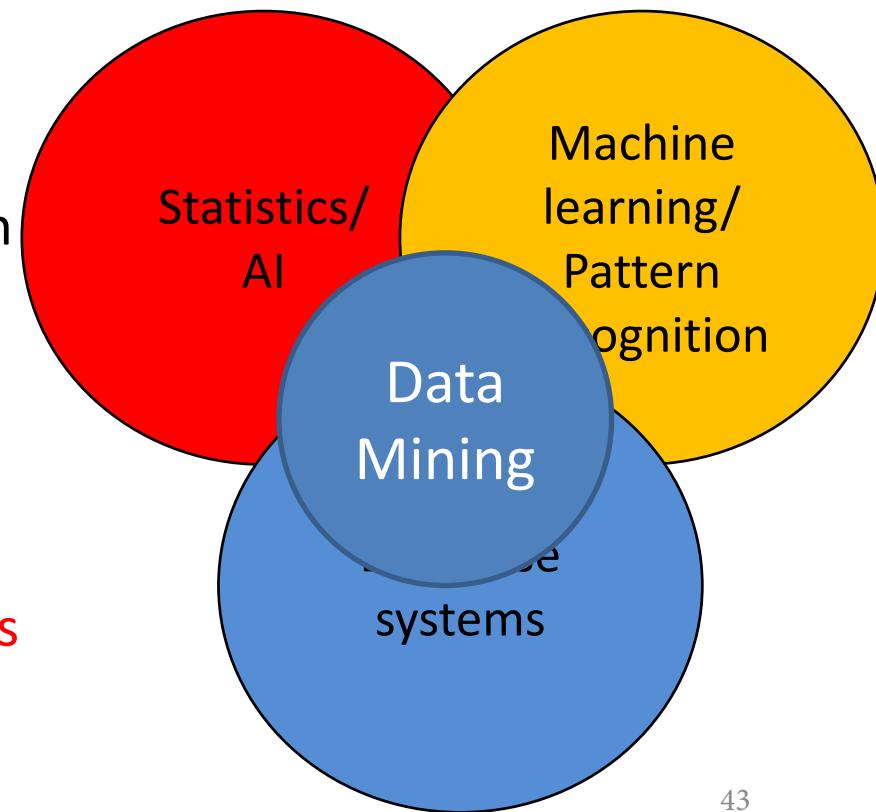

Data Mining: Culture

- Data mining overlaps with:

- Databases: Large-scale data, simple queries
- Machine learning: Small data, Complex models
- Statistics: Predictive Models

- Different cultures:

- To a DB person, data mining is an extreme form of **analytic processing** – queries that examine large amounts of data
 - Result is the query answer
- To a stats/ML person, data-mining is the **inference of models**
 - Result is the parameters of the model

Relation between Data Mining and Data Analytics

- Analytics include both **data analysis (mining)** and **communication** (guide decision making)
- Analytics is not so much concerned with individual analyses or analysis steps, but with the **entire methodology**

Meaningfulness of Answers

- A big data-analytics risk is that you will “discover” patterns that are **meaningless**
- Statisticians call it **Bonferroni’s principle**:
 - (roughly) if you look in more places for interesting patterns than your amount of data will support, you are bound to find crap

Examples of Bonferroni's Principle

- Total Information Awareness (TIA)
 - In 2002, intend to mine all the data it could find, including credit-card receipts, hotel records, travel data, and many other kinds of information in order to track terrorist activity
 - A big objection was that it was looking for so many vague connections that it was sure to find things that were bogus and thus violate innocents' privacy

The “TIA” Story

- Suppose we believe that certain groups of **evil-doers** are meeting occasionally in hotels to plot doing evil
- We want to find (unrelated) people who **at least twice have stayed at the same hotel on the same day**

Details of The “TIA” Story

- 10^9 people might be evil-doers
- Examining hotel records for 1000 days
- Each person stays in a hotel 1% of the time (10 days out of 1000)
- Hotels hold 100 people (so 10^5 hotels, 1% of total people)
- If everyone behaves randomly (i.e., no evil-doers) will the data mining detect anything suspicious?

p at
some
hotel

q at
some
hotel

Calculation (1)

Same
hotel

- Probability that given persons *p* and *q* will be at the same hotel on given day *d*:
 - $1/100 \times 1/100 \times 10^{-5} = 10^{-9}$.
- Probability that *p* and *q* will be at the same hotel on given days *d*₁ and *d*₂:
 - $10^{-9} \times 10^{-9} = 10^{-18}$.
- Pairs of days:
 - 5×10^5

Calculation (2)

- Probability that p and q will be at the same hotel on **some** two days:
 - $5 \times 10^5 \times 10^{-18} = 5 \times 10^{-13}$
- Pairs of people:
 - 5×10^{17}
- Expected number of “suspicious” pairs of people:
 - $5 \times 10^{17} \times 5 \times 10^{-13} = 250,000$

Summary of The “TIA” Story

- Suppose there are 10 pairs of evil-doers who definitely stayed at the same hotel twice
- Analysts have to sift through 250,000 candidates to find the 10 real cases
- Make sure the property, e.g., two people stayed at the same hotel twice, does not allow so many possibilities that random data will surely produce “facts of interest”
- Understanding Bonferroni’s Principle will help you look a little less stupid than a parapsychologist

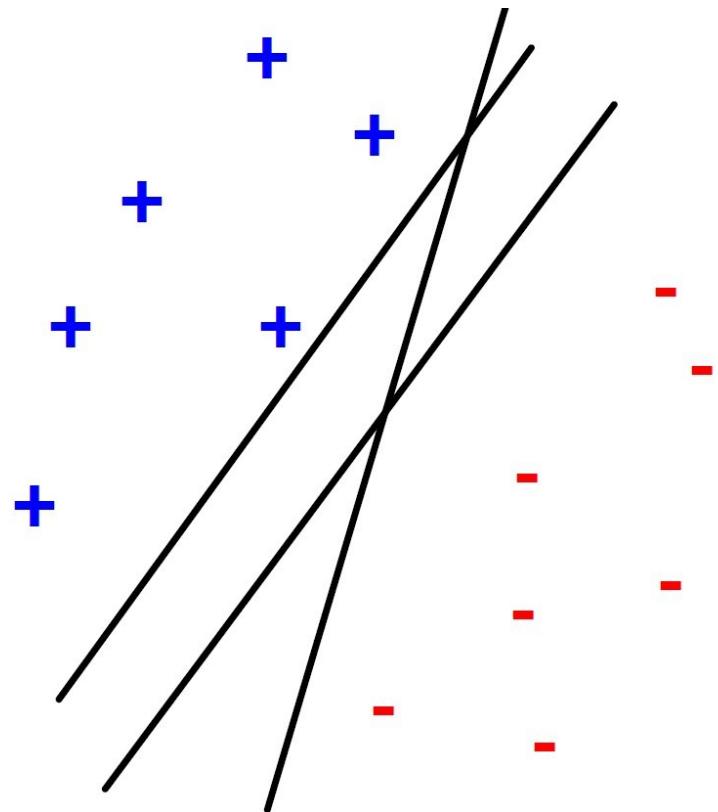

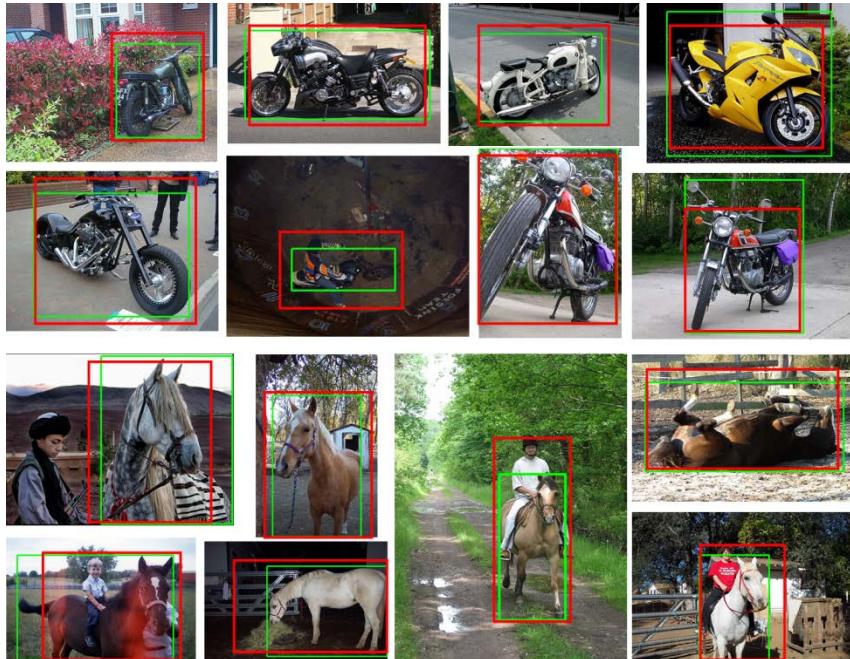

In-class Practice

- Go to [practice](#)

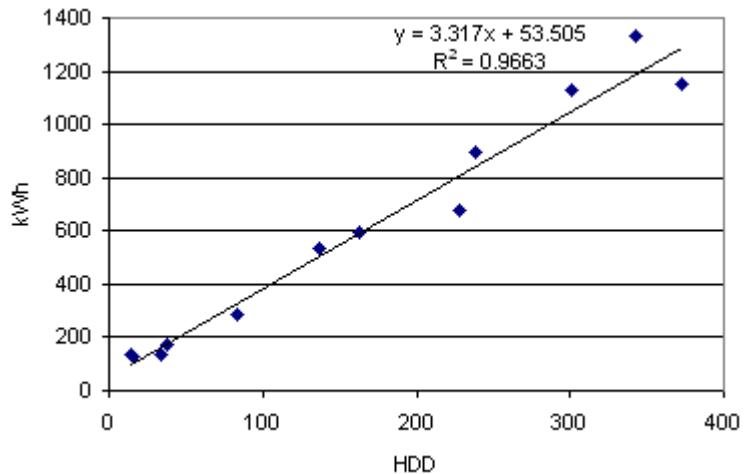

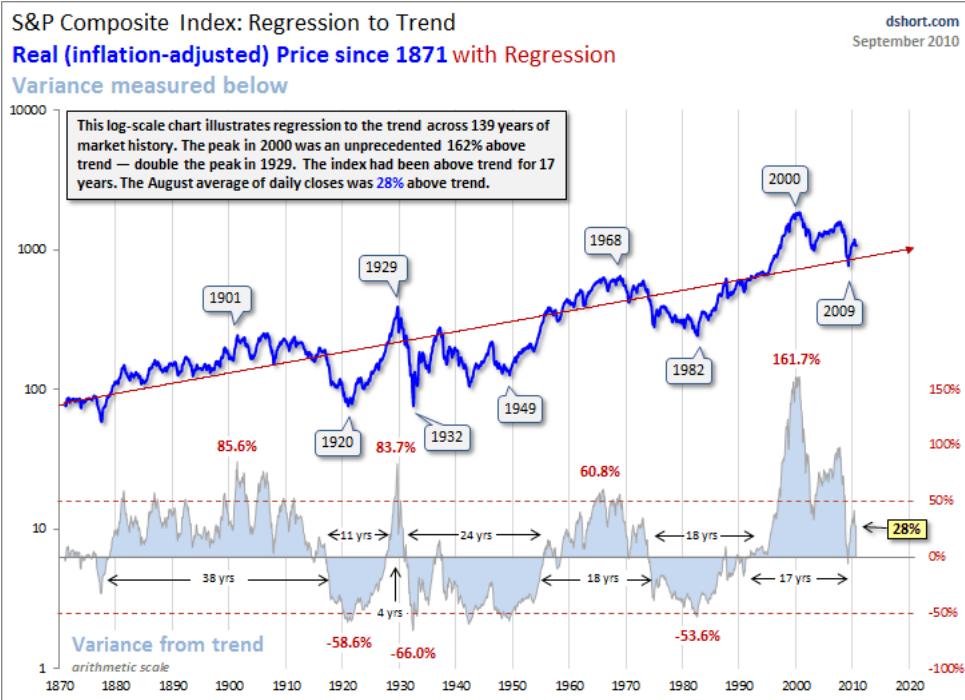

Seven Typical Statistical Problems

1. Object detection(e.g. quasars): classification
2. Photometric redshift estimation: regression, conditional density estimation
3. Multidimensional object discovery: querying, dimension reduction, density estimation, clustering
4. Point-set comparison: testing and matching
5. Measurement errors: errors in variables
6. Extension to time domain: time series analysis
7. Observation costs: active learning

Time Series Analysis

Seven Lessons in Learning from Big Data

1. Big data is a fundamental phenomenon
2. The system must change
3. Simple solutions run out of steam
4. ML becomes important
5. Data quality becomes important
6. Temporal analysis become important
7. Prioritized sensing becomes important

Seven Lessons in Learning from Big Data

1. Big data is a fundamental phenomenon

4. ML becomes important
5. Data quality becomes important
6. Temporal analysis become important
7. Prioritized sensing becomes important

Seven Lessons in Learning from Big Data

1. Big data is a fundamental phenomenon
2. **The system must change**
3. Simple solutions run out of steam
4. ML becomes important
5. Data quality becomes important
6. Temporal analysis become important
7. Prioritized sensing becomes important

Current Options

1. Subsample (e.g. then use R, Weka)
2. Use a simpler method (e.g. linear)
3. Use brute force (e.g. Hadoop)
4. Faster algorithm

What Makes this Hard?

1. The key bottlenecks are fundamental computer science/numerical methods problems of many types
2. Useful speedups are needed.
 1. Error guarantees
 2. Known runtime growths

Seven Typical Tasks of Machine Learning/Data Mining

1. **Querying:** spherical range-search $O(N)$, orthogonal range-search $O(N)$, nearest-neighbor $O(N)$, all-nearest-neighbors $O(N^2)$
2. **Density estimation:** mixture of Gaussians, kernel density estimation $O(N^2)$, kernel conditional density estimation $O(N^3)$
3. **Classification:** decision tree, nearest-neighbor classifier $O(N^2)$, kernel discriminant analysis $O(N^2)$, support vector machine $O(N^3)$, L_p SVM
4. **Regression:** linear regression, LASSO, kernel regression $O(N^2)$, Gaussian process regression $O(N^3)$
5. **Dimension reduction:** PCA, non-negative matrix factorization, kernel PCA $O(N^3)$, maximum variance unfolding $O(N^3)$; Gaussian graphical models, discrete graphical models
6. **Clustering:** k-means, mean-shift $O(N^2)$, hierarchical (FoF) clustering $O(N^3)$
7. **Testing and matching:** MST $O(N^3)$, bipartite cross-matching $O(N^3)$, n-point correlation 2-sample testing $O(N^n)$, kernel embedding

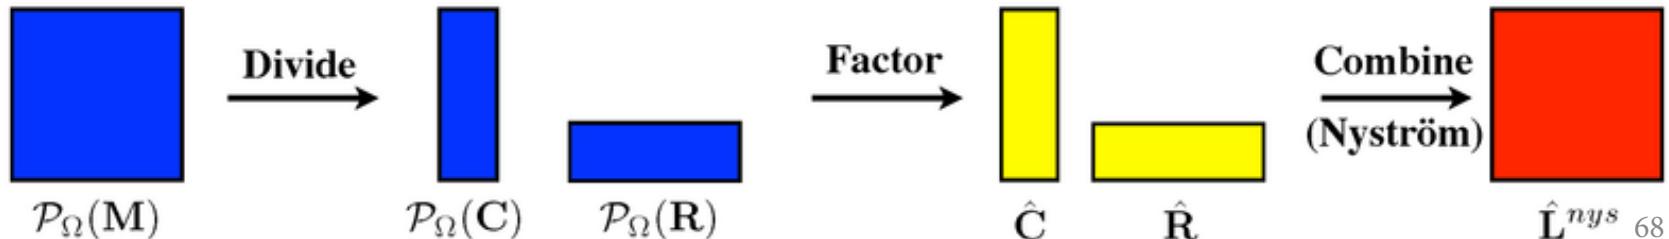

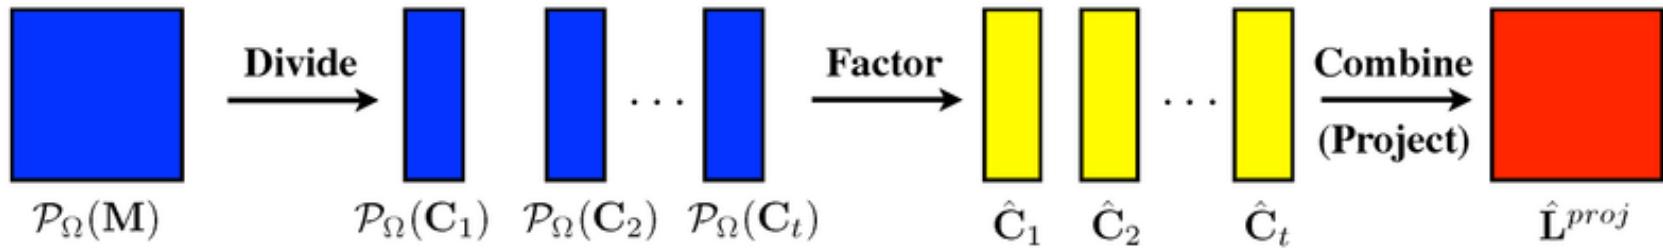

Seven Typical Tasks of Machine Learning/Data Mining

1. **Querying:** spherical range-search $O(N)$, orthogonal range-search $O(N)$, nearest-neighbor $O(N)$, all-nearest-neighbors $O(N^2)$
2. **Density estimation:** mixture of Gaussians, kernel density estimation $O(N^2)$, kernel conditional density estimation $O(N^3)$
3. **Classification:** decision tree, nearest-neighbor classifier $O(N^2)$, kernel classifier $O(N^3)$, L_p SVM
4. **Regression:** linear regression $O(N^2)$, polynomial regression $O(N^3)$, Gaussian process
5. **Dimension reduction:** PCA $O(N^3)$, maximum likelihood models, discrete graphical models, matrix factorization, kernel principal component analysis, sliding windows $O(N^3)$, Gaussian graphical models
6. **Clustering:** k-means, mean-shift $O(N^2)$, hierarchical (FoF) clustering $O(N^3)$
7. **Testing and matching:** MST $O(N^3)$, bipartite cross-matching $O(N^3)$, n-point correlation 2-sample testing $O(N^n)$, kernel embedding

1. Divide and Conquer

- Multidimensional trees:

- K-d trees [Bentley 1970], ball-trees [Omohundro 1991], spill trees [[Liu, Moore, Gray, Yang, nips2004](#)], [cover tree \[Beygelzimer et al.2006\]](#), cosine tree [[Holmes, Isbell, Gray, Nips 2009](#)], subspace trees [[Lee and Gray nips 2009](#)], cone trees [[Ram and Gray kdd2012](#)], max-margin trees [[Ram and Gray SDM 2012](#)], kernel trees [Ram and Gray]

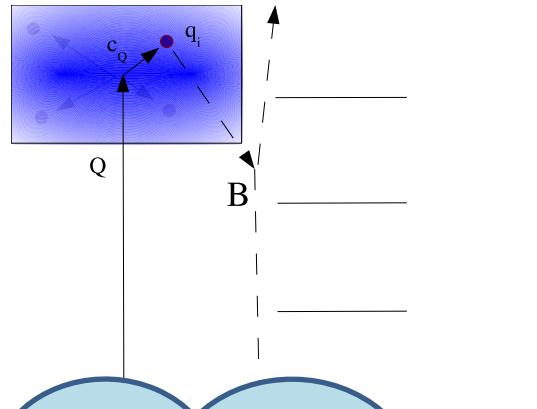

2. Function Transforms

- **Fastest approach for:**

- **Kernel estimation** (low-ish dimension): *dual-tree fast Gauss transforms* (multipole/Hermite expansions) [Lee, Gray, Micchelli, NIPS 2005], [Lee, Micchelli, NIPS 2006]

- **KDE and GMM** (high-ish dimension): *fast Gaussian process regression*, *fast Fourier transform* [Lee, Micchelli, in prep]

Generalized N-body approach is fundamental:
like multidimensional generalization of FFT

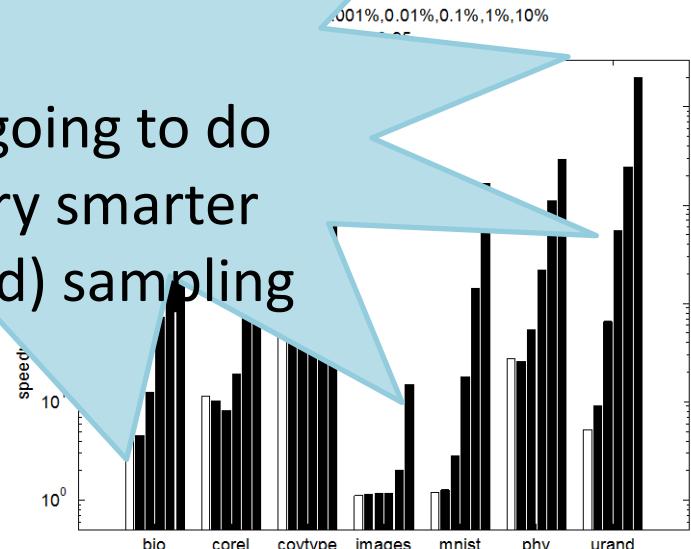

3. Sampling

- **Fastest** approach for (approximate):
 - **PCA**: cosine trees [Holmes, Gray, Isbell, NIPS 2008]
 - **Kernel estimation**: bandwidth learning [Holmes, Gray, Isbell, NIPS 2006], [Holmes, Gray, Isbell, UAI 2007], Monte Carlo multipole method (with SVD trees) [Lee & Gray, NIPS 2009], shadow densities [Kingravi et al., under review]
 - **Nearest-neighbor**: distance-approximate [Liu, Moore, Gray, Yang, NIPS 2004], rank-approximate [Daskalakis et al., FOCS 2008]
 - **spill tree** with random proj [Liu, Moore, Gray, Yang, NIPS 2009]

Rank-approximate

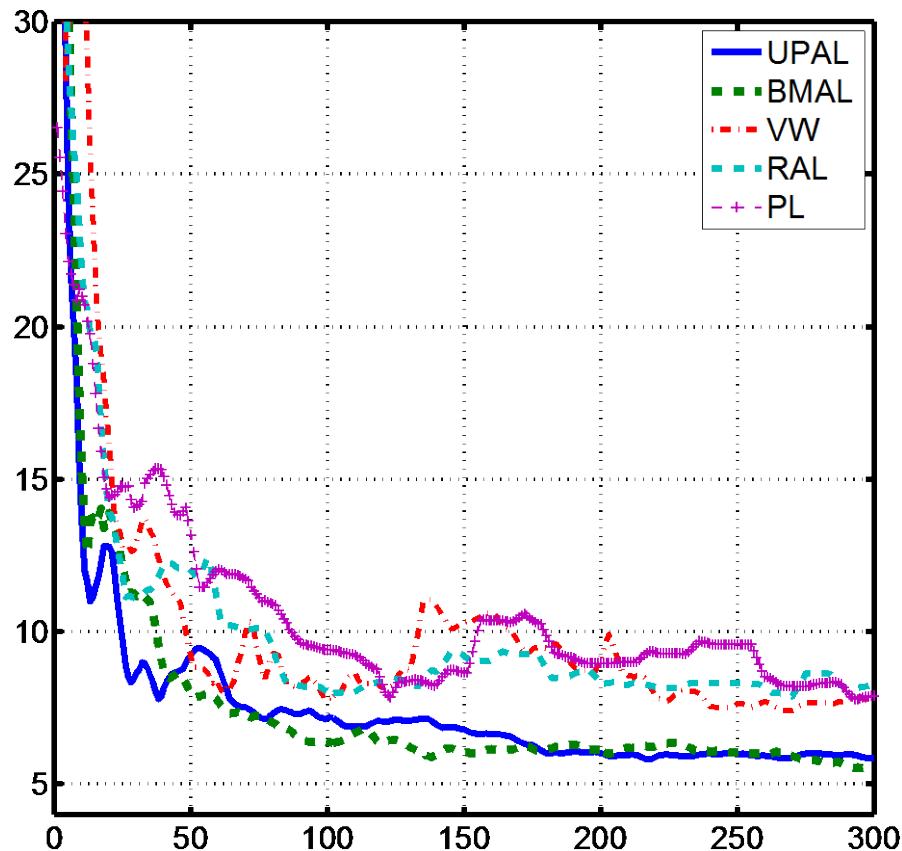

- Best meaning-retaining approximation on the surface of high-dimensional
- More accurate than LSH

3. If you're going to do sampling, try smarter (e.g. stratified) sampling

3. Sampling

- **Active learning:** the sampling can depend on previous samples
 - **Linear classifiers:** rigorous framework for *pool-based active learning* [Sastry and Gray, AISTATS 2012]
 - Empirically allows reduction in the number of objects that require labeling
 - Theoretical rigor: unbiasedness

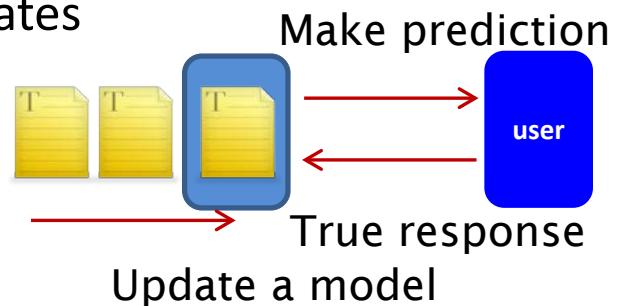

4. Caching

- **Fastest** approach for (using disk):
 - **Nearest-neighbor, 2-point:** *Disk-based tree algorithms* in Microsoft SQL Server [[Riegel, Aditya, Budavari, Gray, in prep](#)]
 - Builds k-d tree on top of built-in B-trees
 - Fixed-pass algorithm to build k-d tree

No. of points	MLDB(Dual tree)	Naive
40,000	8 seconds	159 seconds
200,000	43 seconds	3480 seconds
10,000,000	297 seconds	80 hours
20,000,000	29 mins 27 sec	74 days
40,000,000	58 mins 48 sec	280 days
40,000,000	112 mins 32 sec	2 years

5. Streaming/Online

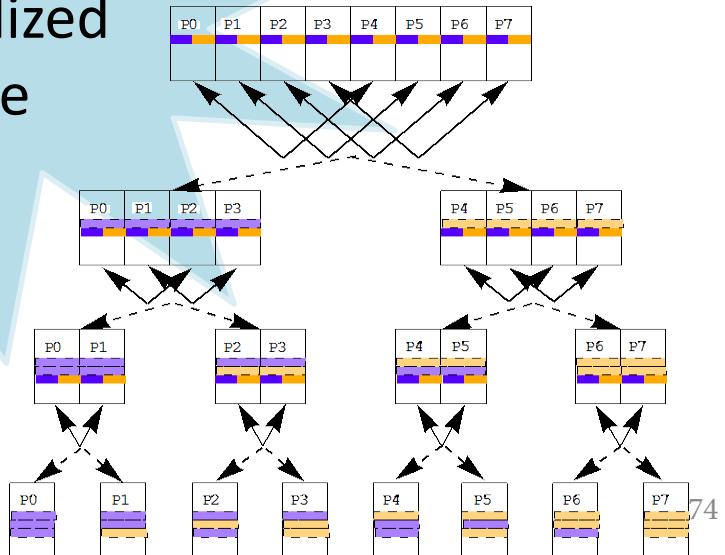

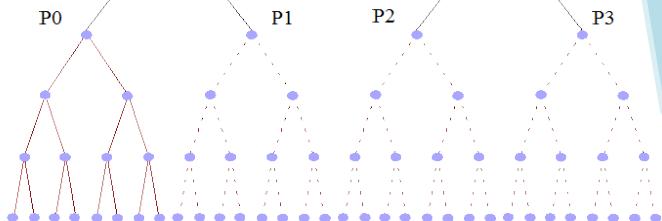

- **Fastest** approach for (approximate, or streaming):
 - *Online learning/stochastic optimization*: just use the current sample to update the gradient
 - **SVM** (squared hinge loss): stochastic Frank-Wolfe [[Ouyang and Gray, SDM 2010](#)]
 - **SVM, LASSO, et al.**: noise-adaptive stochastic approximation (NASA) [[Ouyang and Gray, KDD 2010](#)], accelerated non-smooth SGD (ANSGD) [[Ouyang and Gray, ICML 2012](#)]
 - faster than SGD
 - solves step size problem
 - beats all existing convergence rates

6. Parallelism

- Fastest approach for (using many machines):
 - KDE, GP, n-point: *distributed trees* [Lee and Gray , SDM 2012 Best Paper], 6000+ cores; [March et al, Supercomputing 2012], 100K cores
 - Each process owns the global tree and its local tree
 - First $\log p$ levels built in parallel; each process determines where to send data
- Asynchronous averaging
 - SVM, LASSO, et al.
 - Provable theory

6. Parallelized fast
alg. > parallelized
brute force

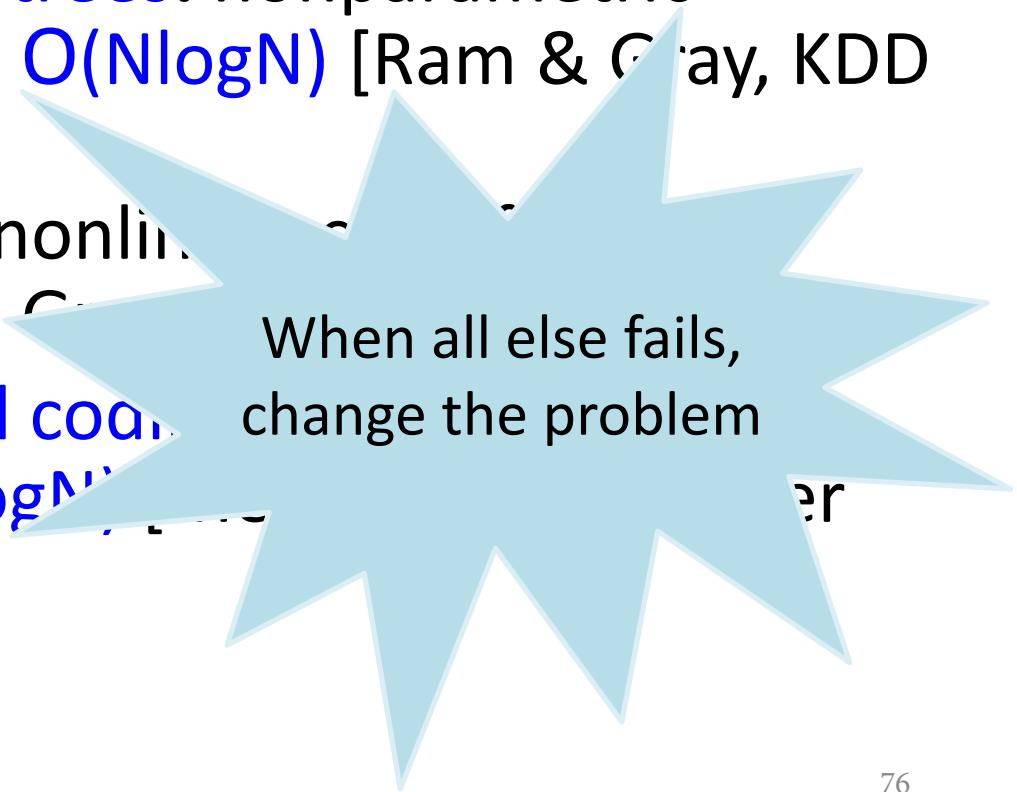

7. Transformations between Problems

- Change the **problem type**:
 - Linear algebra on kernel matrices → N-body inside conjugate gradient [Gray, TR 2004]
 - Euclidean graphs → N-body problems [March & Gray, KDD 2010]
 - HMM as graph → matrix factorization [Tran & Gray, in prep]
- Optimizations: reformulate the **objective and constraints**:
 - Maximum variance unfolding: *SDP via Burer-Monteiro convex relaxation* [Vasileoglou, Gray, Anderson MLSP 2009]
 - L_q SVM, $0 < q < 1$: *DC programming* [Guan & Gray, CSDA 2-11]
 - L_0 SVM: mixed integer nonlinear program via perspective cuts [Guan & Gray, under review]
 - Do reformulations automatically [Agarwal et al, PADL 2010],[Bhat et al, POPL 2012]

7. Transformations between Problems

- Create new ML methods with desired computational properties:
 - Density estimation trees: nonparametric density estimation, $O(N \log N)$ [Ram & Gray, KDD 2011]
 - Local linear SVMs: nonlinear classification $O(N \log N)$ [Sastry & Cawley, 2011]
 - Discriminative local coordinate descent for classification $O(N \log N)$ [Cawley & Cawley, 2011] [review]

When all else fails,
change the problem

A large, fluffy white cloud against a dark blue sky.

What is cloud computing?

The best thing since sliced bread?

- Before clouds...
 - Grids
 - Vector supercomputers
 - ...
- Cloud computing means many different things:
 - Large-data processing
 - Rebranding of web 2.0
 - Utility computing
 - Everything as a service

Rebranding of web 2.0

- Rich, interactive web applications
 - Clouds refer to the servers that run them
 - AJAX as the de facto standard (for better or worse)
 - Examples: Facebook, YouTube, Gmail, ...
- “The network is the computer”: take two
 - User data is stored “in the clouds”
 - Rise of the netbook, smartphones, etc.
 - Browser *is* the OS

Utility Computing

- What?

- Computing resources as a metered service (“pay as you go”)
- Ability to dynamically provision virtual machines

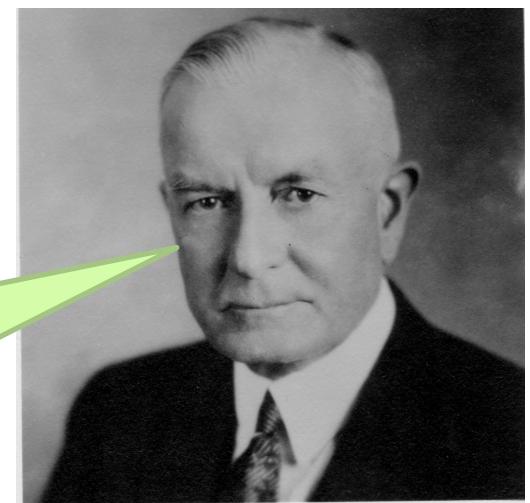

- Why?

- Cost: capital vs. operating expenses
- Scalability: “infinite” capacity
- Elasticity: scale up or down on demand

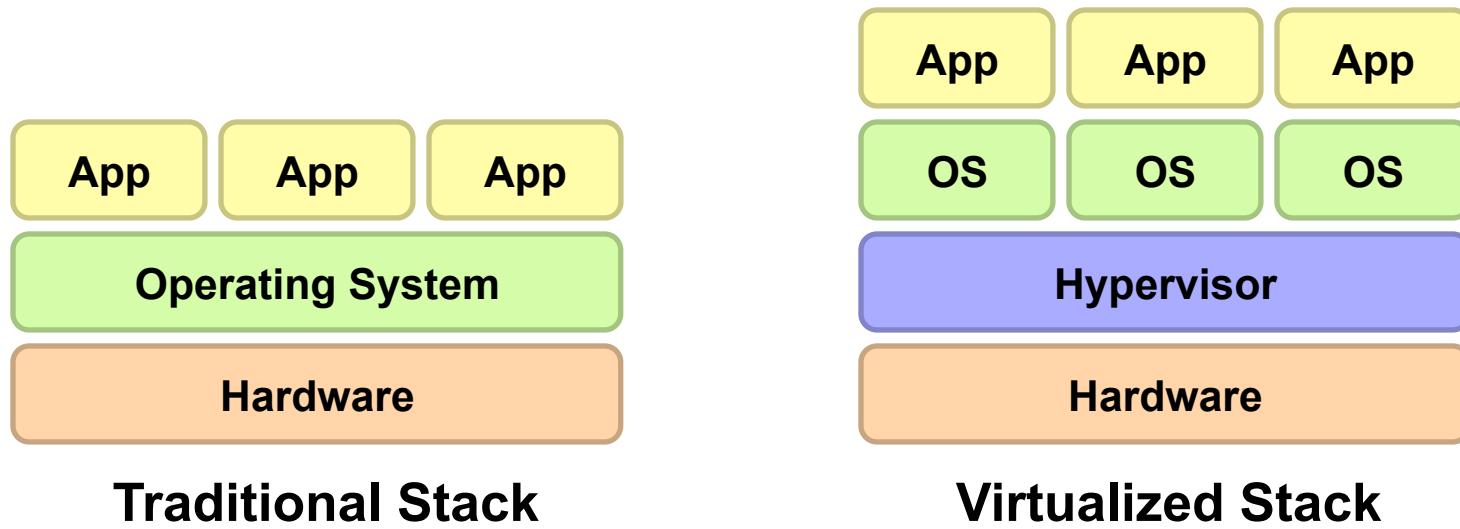

- Does it make sense?

- Benefits to cloud users
- Business case for cloud providers

I think there is a world market for about five computers.
– Thomas J Watson of IBM, 1943

Enabling Technology: Virtualization

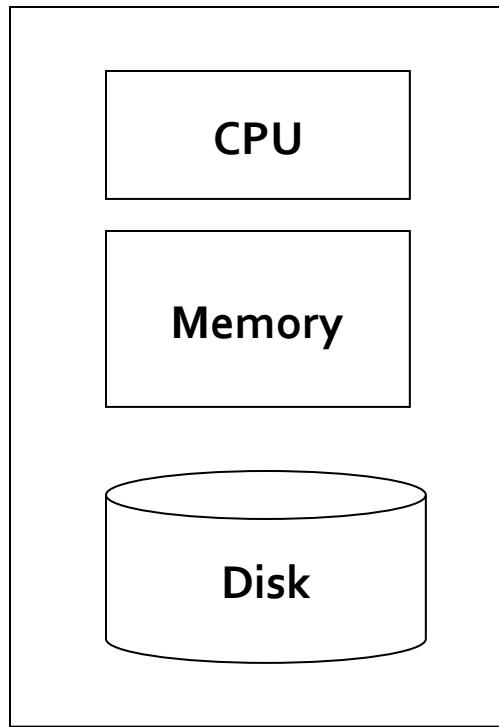

Everything as a Service

- Utility computing = Infrastructure as a Service (IaaS)
 - Why buy machines when you can rent cycles?
 - Examples: Amazon's EC2, Rackspace
- Platform as a Service (PaaS)
 - Give me nice API and take care of the maintenance, upgrades, ...
 - Example: Google App Engine
- Software as a Service (SaaS)
 - Just run it for me!
 - Example: Gmail, Salesforce

How do we scale up processing for Big Data ?

**Or: How to run Algorithms on MANY REAL and FAULTY
boxes ?**

Single Node Architecture

“Classical”
Machine Learning, Statistics,
Data Mining

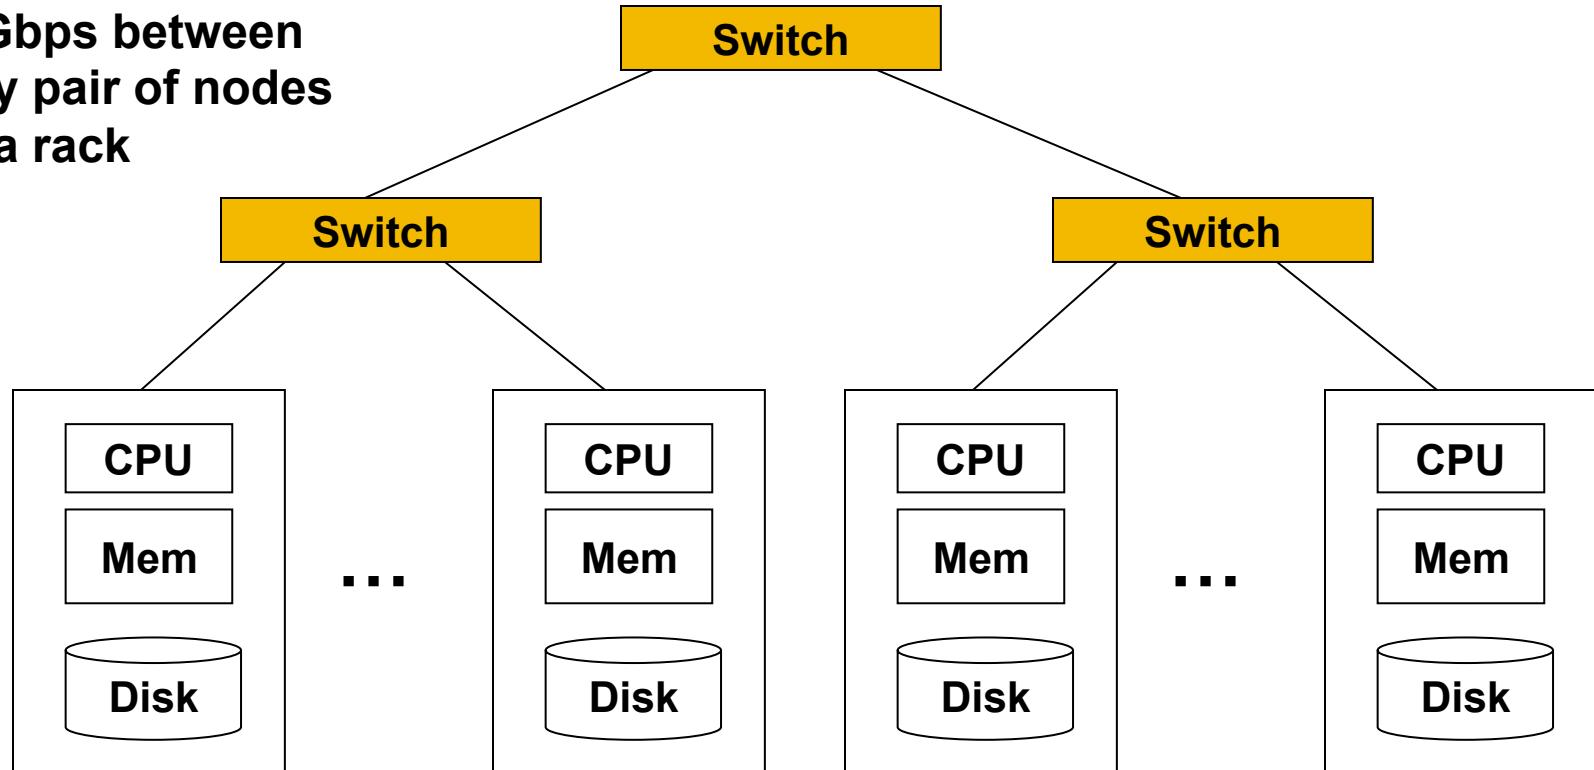

Motivation: Google Example

- 20+ billion web pages x 20KB = 400+ TB
- 1 computer reads 30-35 MB/sec from disk
 - ~4 months to read the web
- ~1,000 hard drives to store the web
- Takes even more to **do something useful with the data!**
- **Today, a standard architecture for such problems is emerging:**
 - Cluster of commodity Linux nodes
 - Commodity network (ethernet) to connect them

Cluster Architecture

1 Gbps between
any pair of nodes
in a rack

2-10 Gbps backbone between racks

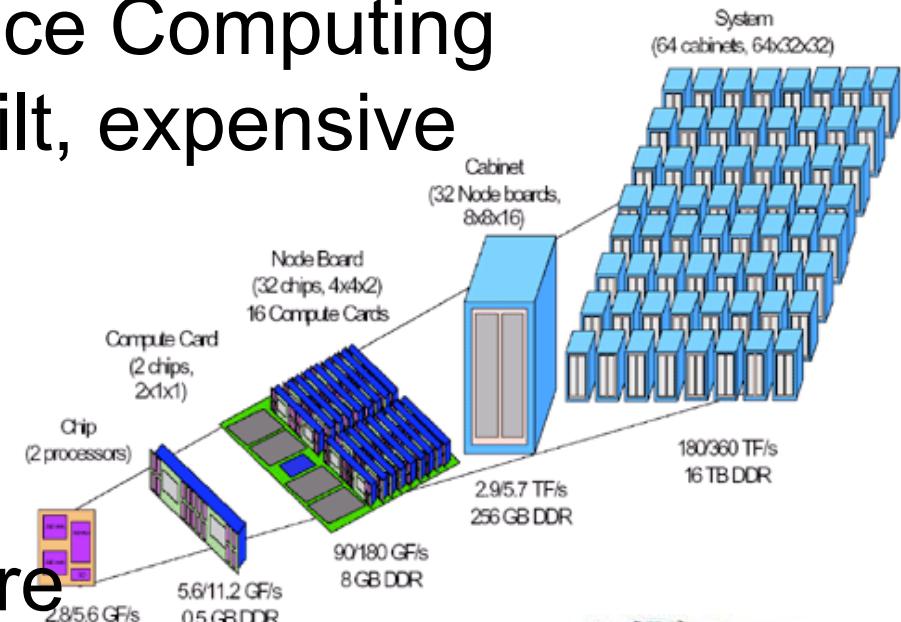

Each rack contains 16-64 nodes

In 2011, it was guestimated that Google had 1M machines, <http://bit.ly/Shh0RO>

Using Commodity Hardware

- 80-90's: High Performance Computing
Very reliable, custom built, expensive

- Now: Consumer hardware
Cheap, efficient, easy to replicate,
BUT not very reliable,

Why commodity machines?

	HP INTEGRITY SUPERDOME-ITANIUM2	HP PROLIANT ML350 G5
Processor	64 sockets, 128 cores (dual-threaded), 1.6 GHz Itanium2, 12 MB last-level cache	1 socket, quad-core, 2.66 GHz X5355 CPU, 8 MB last-level cache
Memory	2,048 GB	24 GB
Disk storage	320,974 GB, 7,056 drives	3,961 GB, 105 drives
TPC-C price/performance	\$2.93/tpmC	\$0.73/tpmC
price/performance (server HW only)	\$1.28/transactions per minute	\$0.10/transactions per minute
Price/performance (server HW only) (no discounts)	\$2.39/transactions per minute	\$0.12/transactions per minute

Fault Tolerance

- Performance goal

- 1 failure per year

- for a 1000-machine Cluster

not IBM Deskstar!

- Poisson approximation

$$\Pr(n) = \frac{1}{n!} e^{-\mu} \mu^n$$

- Assume failure rate μ per machine

- Poisson rates of **independent** random variables are additive, so we can combine

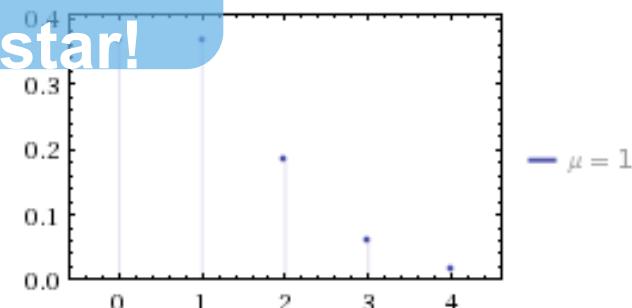

=> With Fault Intolerant Engineering

We need a rate of 1 failure per 1000 years per machine

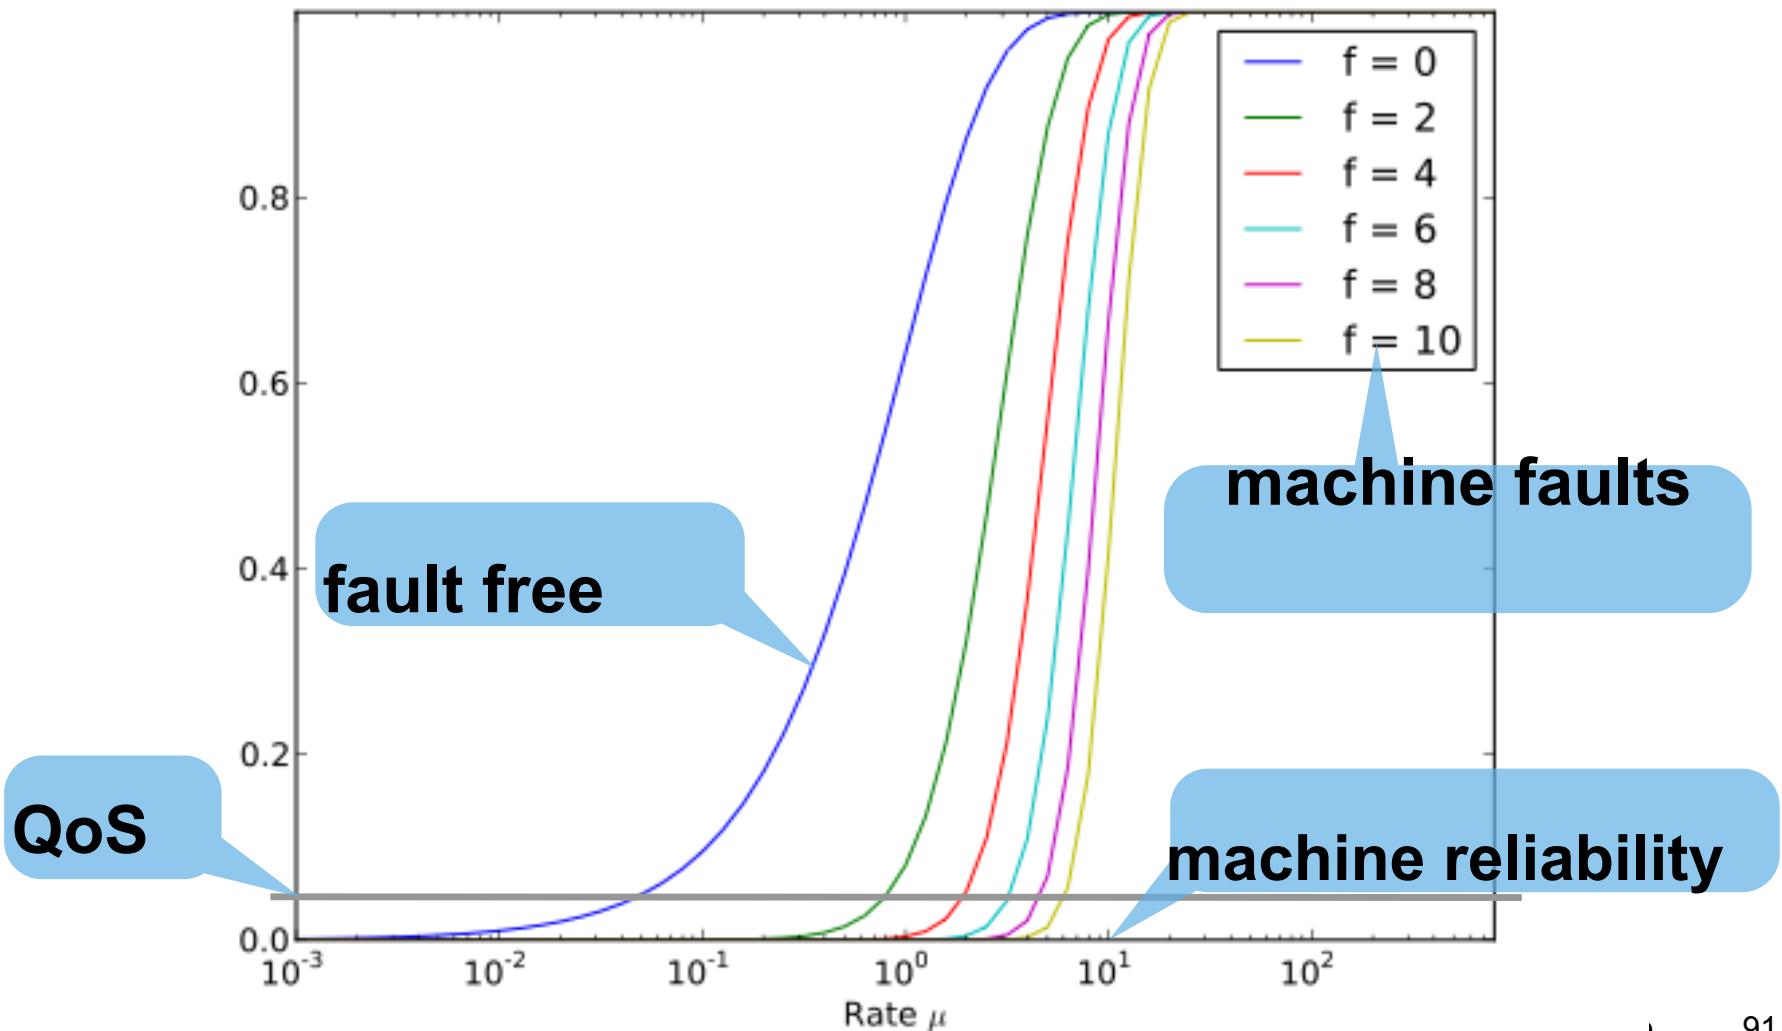

- Fault tolerance

Assume we can tolerate k faults among m machines in t time

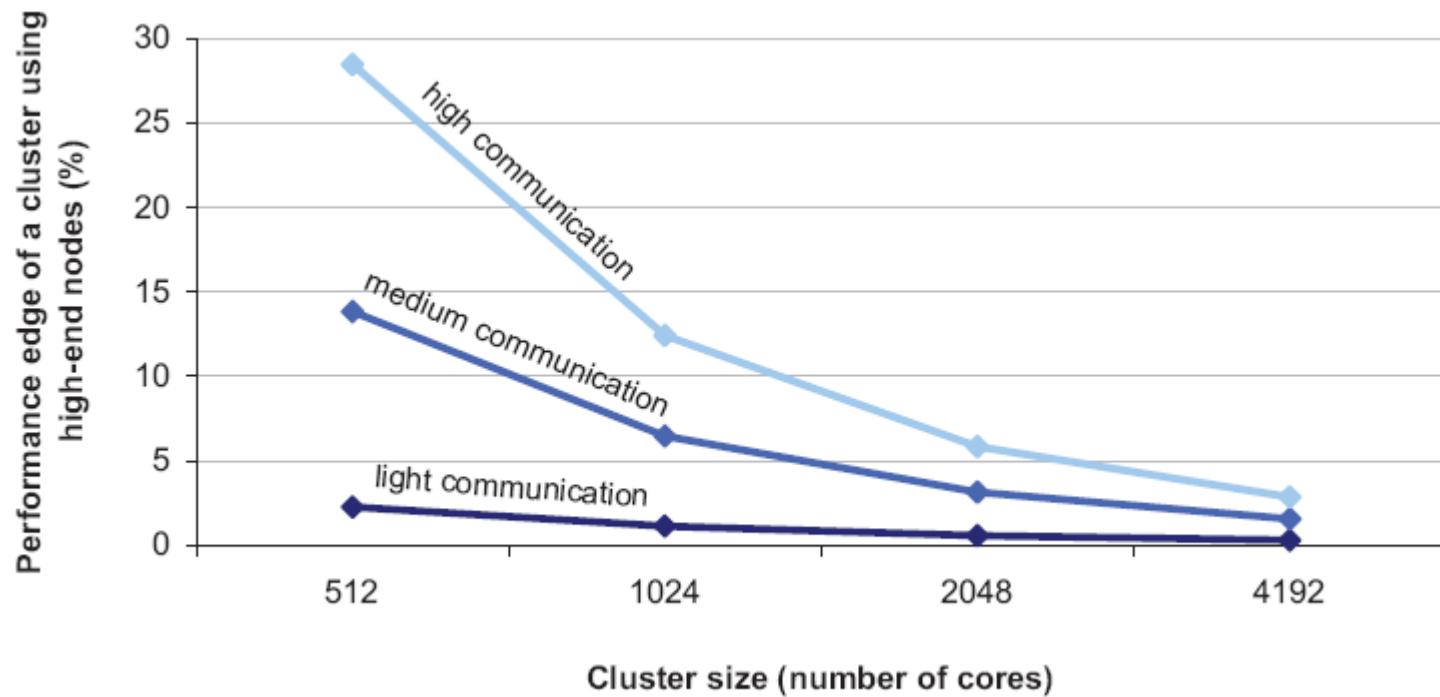

$$\Pr(f > k) = 1 - \sum_{n=0}^k \frac{1}{n!} e^{-\lambda t} (\lambda t)^n$$

Fault tolerance

Advantages of scaling “out”

So why not?

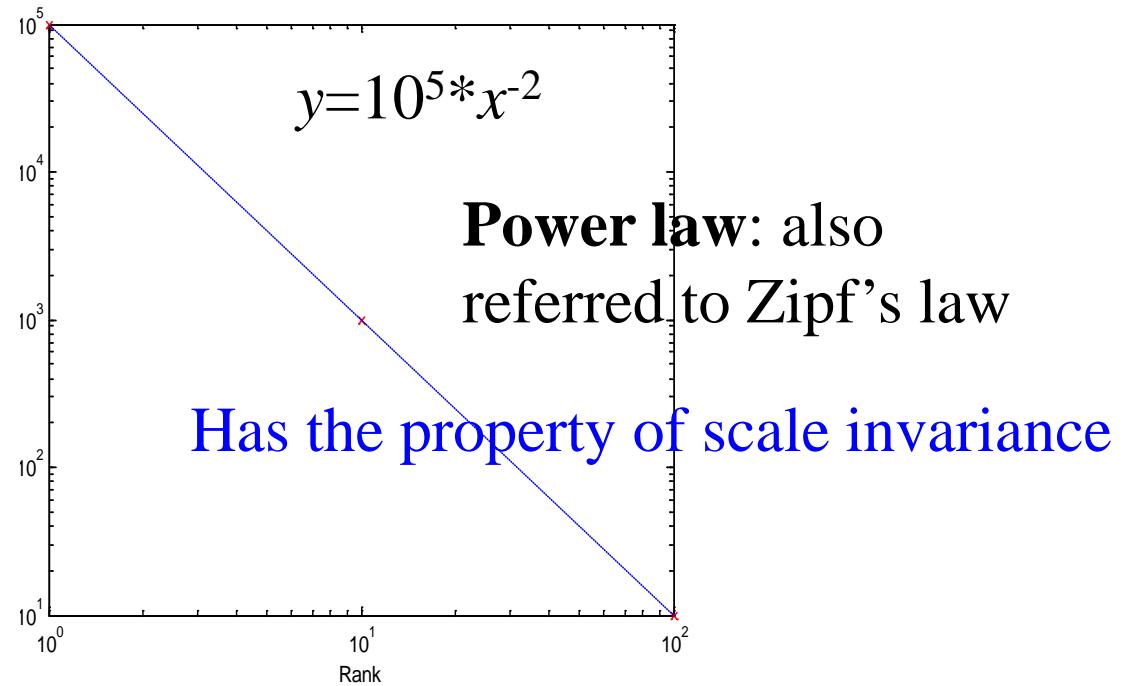

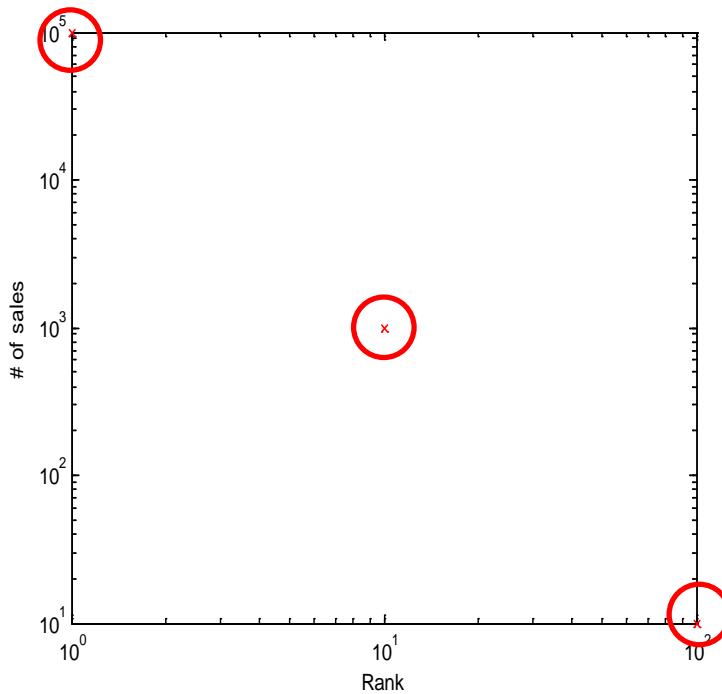

In-class Practice

- Let us examine fragrance sales at ebay in a year. Suppose
 - the best selling product sold 100,000 pieces,
 - the 10th best-selling product sold 1,000 pieces,
 - the 100th best selling product sold 10 pieces.
- How to derive the relationship between the number of fragrance sold and the order?

In-class Practice

- Let y be the number of sales of the x -th best-selling fragrance products in a year at ebay.
